ABSTRACT:

PROBLEM TO BE SOLVED: To lower manufacturing cost by reducing the number of components and simplifying a structure in a liquid crystal display device.

SOLUTION: The liquid crystal display device has a liquid crystal display panel PNL, an intermediate frame MFR, on the upper side of which the liquid crystal display panel PNL is mounted and on the lower side of which a backlight part BL is mounted and a drive circuit substrate electrically connected with the liquid crystal display panel PNL through a flat cable FC and engaged with the intermediate frame MFR, so as to be overlapped by the end part of the liquid crystal display panel PNL along two sides adjacent to each other of the liquid crystal display panel PNL. A connector connected with an external device and a power source circuit are mounted on the drive circuit substrate.
